

Patient Chart Scanning Solutions

Business Information Solutions

RICOH
imagine. change.

EMR adoption by primary care physicians in Canada has more than doubled since 2006. Today nearly 60% of practices nationally are using an EMR.*

The Business Challenge

Paper-based documents can plague ambulatory medical practices. Even as they adopt electronic medical record (EMR) systems, making paper-based documentation available electronically can be a challenge. Without an effective solution, medical practices will continue to have communication gaps within the practice, among clinicians in different locations, and between clinicians and patients.

Ricoh has everything you need to bring your paper-based documents into your digital workflow.

Ricoh has been helping healthcare providers eliminate the inefficiencies of document-based processes for over 20 years with best-in-class products, software and integration expertise. Our Patient chart scanning solutions help caregivers to easily capture paper-based documents in an EMR friendly file structure format and link them to the correct patient record in the EMR. This can help your medical practice realize:

- Enhanced caregiver collaboration
- Streamlined document management
- Improved patient data capture and efficiency
- Improved access to critical clinical data
- Reduced chart storage space requirements

	<p>Are your paper-driven processes slowing down workflow or contributing to inaccurate data use?</p> <p>The limitations of paper charts and the inability to access and update information can adversely affect quality of care. Ricoh offers a complete scanning workflow solution for capturing patient charts, loose filing and importing faxes into a patient directory structure or directly to the EMR. Paper-based processes become a thing of the past, improving speed, accuracy and care delivery.</p>
	<p>How secure are your records? Are you complying with Personal Health Information regulations? Are you monitoring regulatory requirements?</p> <p>Integrating paper with Electronic Medical Records is an important step in meeting personal health information security requirements. Ricoh's digital scanning technology makes it easy to file, search, retrieve and disseminate documents in the EMR, supporting your regulatory and Electronic Health Records adoption initiatives goals.</p>
	<p>Are paper based clinical charts making it difficult to share up to date patient records with other care providers?</p> <p>A shared electronic record of personal health information can be readily accessed by other care providers, regardless of where they are located. It is also more likely to be up-to-date and requires less space and fewer administrative resources to maintain. A complete Electronic Health Record supports improved clinical decision-making, greater patient safety, and increased efficiency.</p>
