

HYBRID BACKUP

ON-PREMISES AND CLOUD BACKUP SOLUTION WITH MONITORING, MANAGEMENT AND RECOVERY SUPPORT

PRODUCT OVERVIEW

Hybrid Backup provides a simple, best practices approach to enterprise backup for physical and virtual servers (Hyper-V/VMware). Combining an on-site backup appliance and secure replication to the cloud, this solution includes leading edge technology, data deduplication, encryption, cloud storage and multiple retention capabilities to meet the most stringent requirements. Included turnkey deployment and management services provide the comfort and confidence that your critical systems are backed up, monitored and managed 24/7/365 by our team of experts. Offered on a flat monthly cost based on the size of the backup appliance, this solution provides cost certainty and is easily scalable as your organization grows.

FULLY MANAGED BACKUP & RECOVERY

This fully managed solution includes leading edge hardware, software, installation, monitoring and management services.

24/7/365 LIVE AGENT SUPPORT

Access a live agent on demand to assist with problems, questions and requests relating to your backup and recovery requirements.

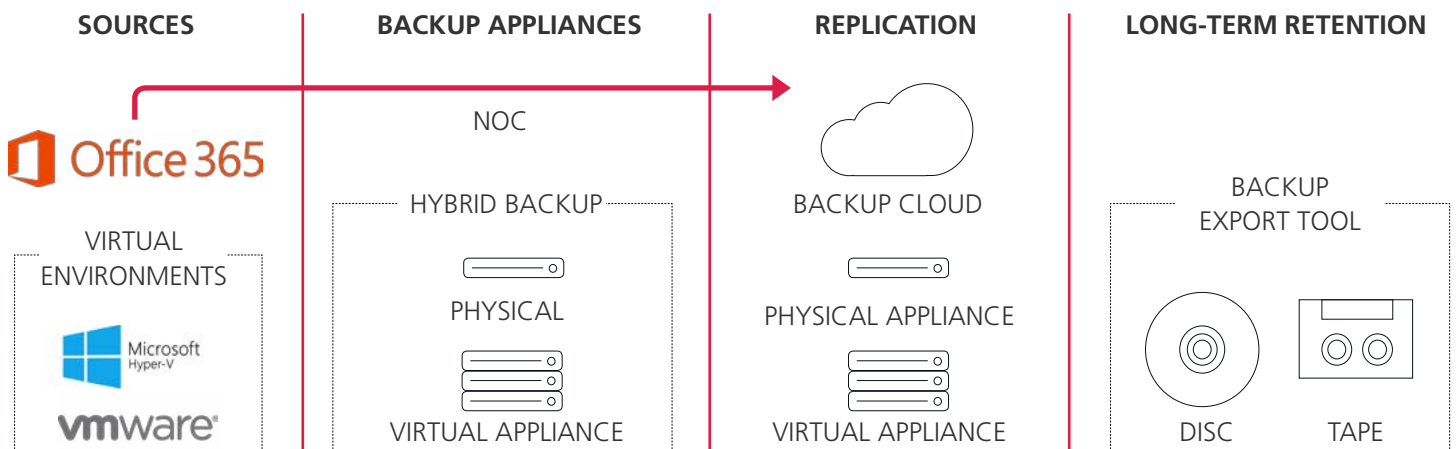

RAPID DEPLOYMENT SERVICES

Backup jobs quickly and efficiently to meet recovery point and time objectives according to industry best practices.

FIXED MONTHLY COST

Pricing structure is based on a flat monthly fee with no setup costs. Backup your critical data with confidence and price certainty.

HOW IT WORKS

INTEGRATION

Easily integrate our hybrid backup solution into your IT environment and receive secure data replication. This turnkey solution provides full lifecycle management for your backups including installation, setup, configuration, monitoring, remediation and restoration support. We will configure the solution to meet your requirements, including the type of backups (file, folders, application or full system backup) and frequency of backup.

Identify devices needed for the service

Set up rules & requirements for backup

Shipment of appliance to your site

On-site configuration of appliance & cloud replication

Full backup & monitoring services & analysis

INCLUDED BASIC FEATURES

INLINE DEDUPLICATION

Inline deduplication built into the on-premises appliance lets organizations significantly reduce storage needs, bandwidth requirements and backup costs.

REPLICATION

Advanced replication technology lets you protect against local disasters and data loss by using the cloud to get data off-site simply and cost-effectively much better.

OFF-SITE VAULTING

Organizations with conservative retention policies can use off-site vaulting to minimize the cost of backup storage.

MATCHED CLOUD STORAGE

Enjoy the same amount of storage as the on-site appliance in the cloud to facilitate an off-site copy of your backups and/or use in conjunction with off-site vaulting to keep multiple versions of data off-site.

INSTANT REPLACEMENT

In the event of a complete site disaster or a failure of the appliance, our team will preload the most recent data and configuration settings stored in Backup Cloud onto a replacement unit.
